Systemic adjuvant chemotherapy in colon cancer

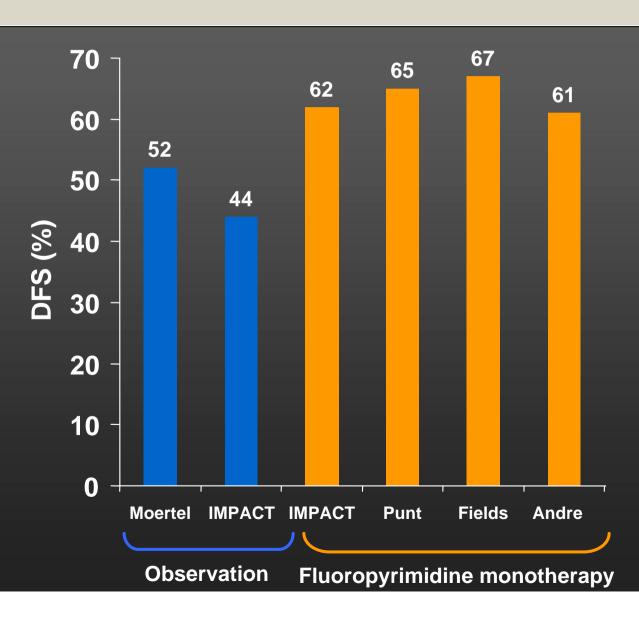

Prof.Dr.Hans-Joachim Schmoll Director, Department of Haematology and Oncology Martin Luther University Halle, Germany

Incidence of colorectal cancer in the U.S. and Western Europe 2006 (n~300,000)

3-year DFS in stage III CRC 5FU +/- FA

X-ACT trial in adjuvant treatment of stage III colon cancer

Recruitment 1998–2001

Capecitabine 1250mg/m² twice daily, d1–14, q21d n=1004

Chemo-naïve stage III, resection £8 weeks

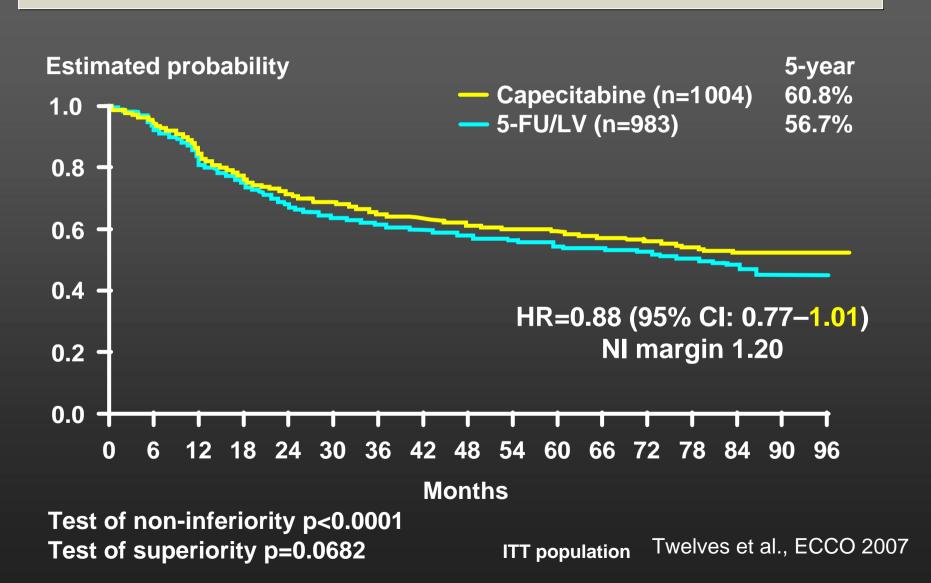

24 weeks

Bolus 5-FU/LV 5-FU 425mg/m² plus LV 20mg/m², d1–5, q28d n=983

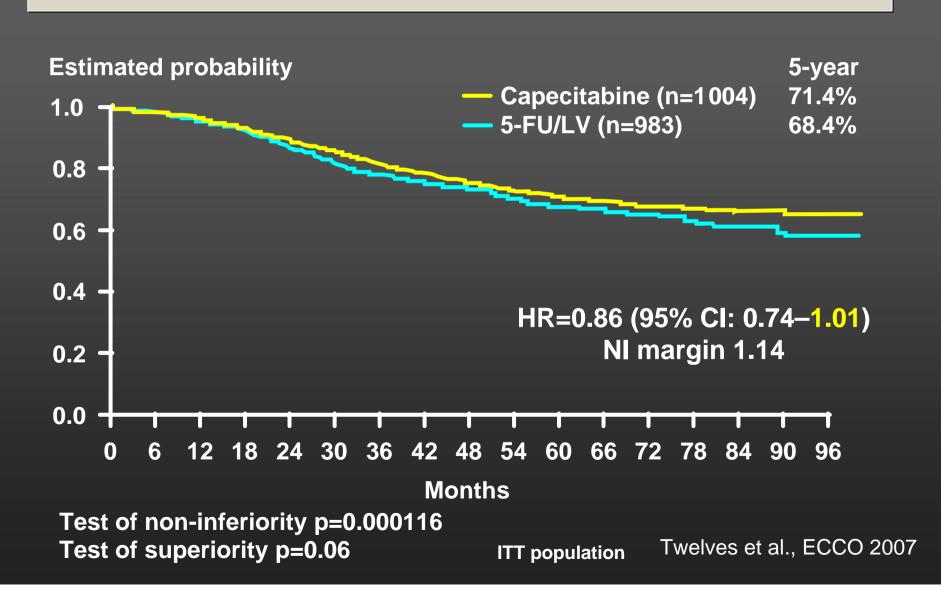

- 1° endpoint: disease-free survival (DFS)
- 2° endpoints
 - overall survival (OS)
 - relapse-free survival (RFS)
 - tolerability (NCIC CTG)
 - pharmacoeconomics
 - QoL

Twelves et al., ECCO 2007

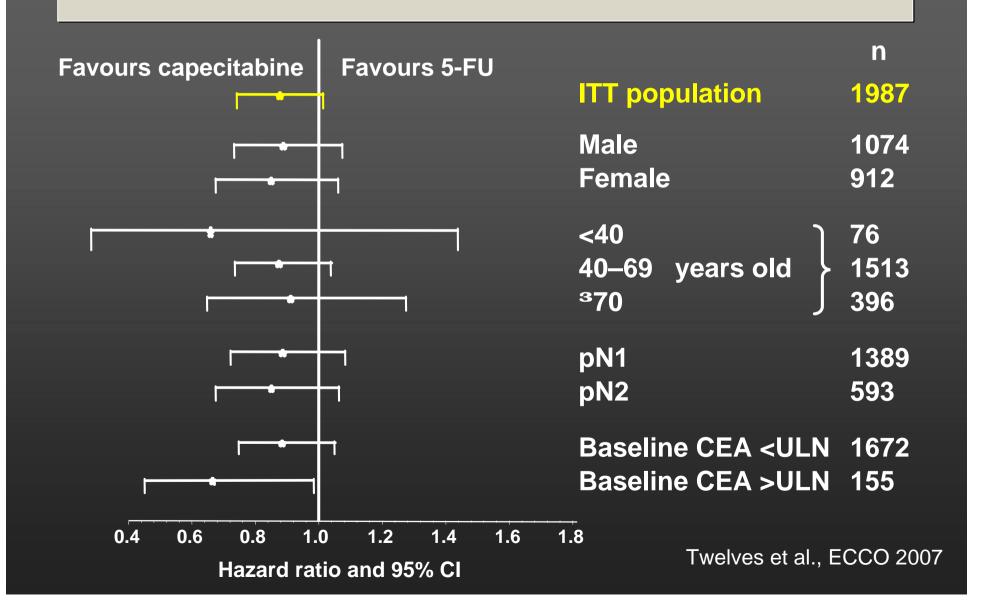

Disease-free survival: 5-year update – median follow-up 6.8 years

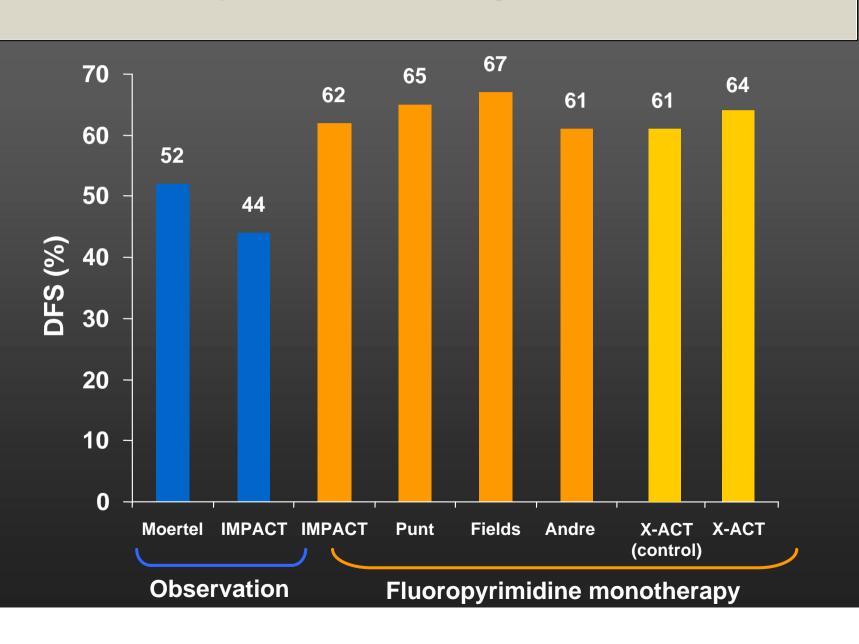

Overall survival: 5-year update – median follow-up 6.8 years

5-year overall survival subgroup analysis

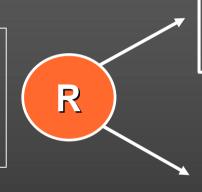

3-year DFS in stage III CRC

MOSAIC and NSABP C04

Oxaliplatin combinations: MOSAIC

2246 patients with completely resected stage II (40%) or III (60%) colon cancer

FOLFOX4

(LV5FU2 + oxaliplatin 85 mg/m²) 12 cycles

> LV5FU2 12 cycles

- Primary endpoint: DFS
- Secondary endpoints: safety, OS

Oxaliplatin combinations: NSABP C-07

2492 patients with stage II and III colon cancer

5-FU/LV

5-FU: 500 mg/m² iv bolus weekly x 6 LV: 500 mg/m² iv weekly x 6 each 8-week cycle x 3, n=1207

FLOX

5-FU/LV + oxaliplatin 85 mg/m² iv on Weeks 1, 3 and 5 of each 8-week cycle x 3, n=1200

Primary endpoint: 3-year DFS

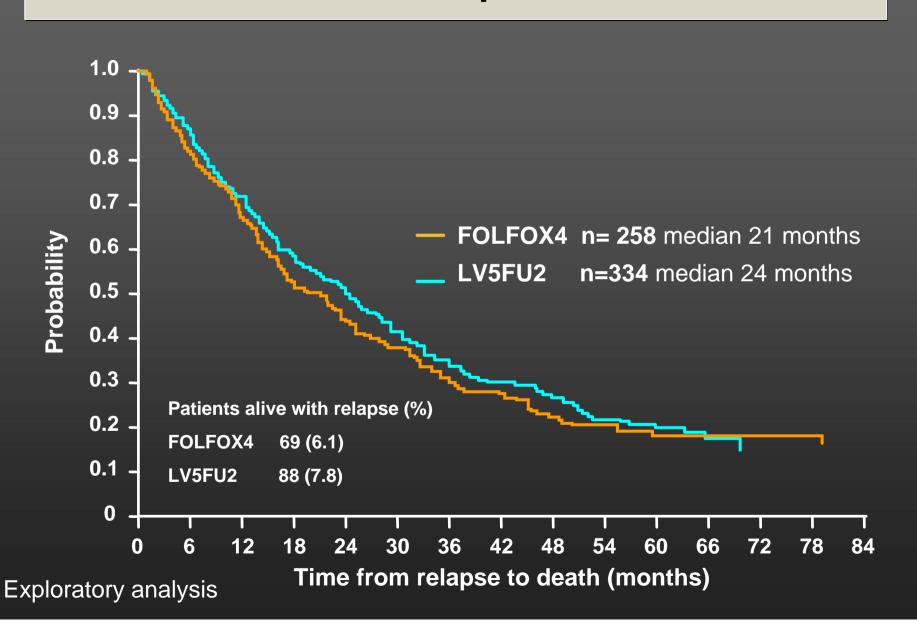

3-year DFS (stage II and III)

| | 3-year DFS | ? | HR |
|--------|------------|------|------|
| C-07 | 76.5% | 4.9% | 0.79 |
| MOSAIC | 78.2% | 5.3% | 0.77 |

Mosaic: Disease-free Survival - 2007 Update

| | 5-year DFS % | | | |
|--------------------------|--------------|--------|----------------|---------|
| Data cut-off: June 2006 | FOLFOX4 | LV5FU2 | HR [95% CI] | p-value |
| ITT (overall population) | 73.3 | 67.4 | 0.80 | 0.003 |
| | | | [0.68–0.93] | |
| Stage III | 66.4 | 58.9 | 0.78 | 0.005 |
| | | | [0.65–0.93] | |
| Stage II | 83.7 | 79.9 | 0.84 | 0.258 |

| NSABP C02 | 718 | GERCOR | 905 |
| GIVIO | 867 | QUASAR | 3517 |

Total: 17 trials; 17,381 pts

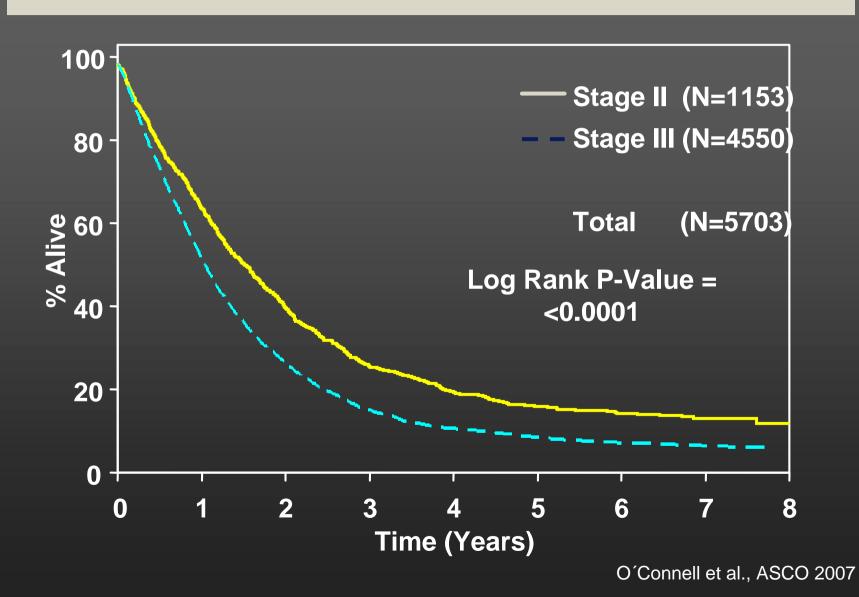

3 Year DFS vs 5 Year OS

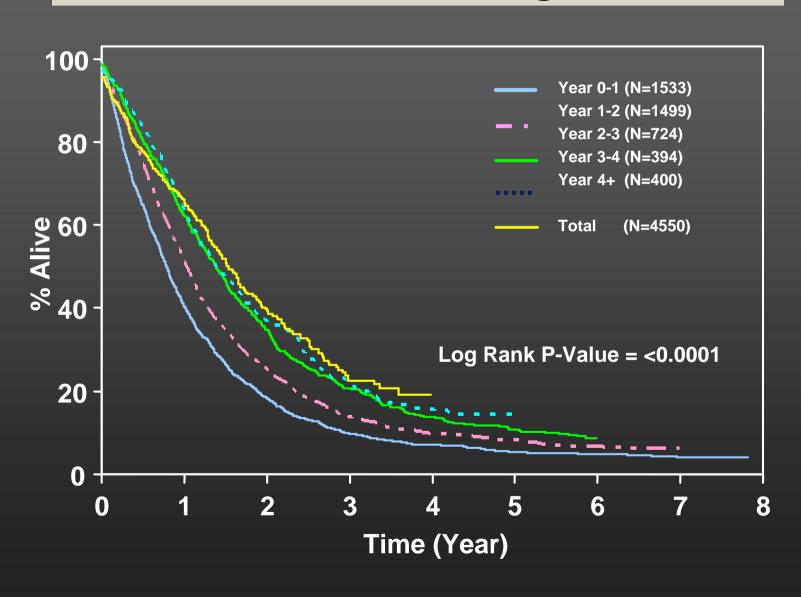

Recurrence Rate by time from randomization (all pts)

Time from Recurrence to Death by Stage

Time from Recurrence to Death by Year of Recurrence for Stage III Patients

XELOX

NO16968 study

Stage III colon cancer

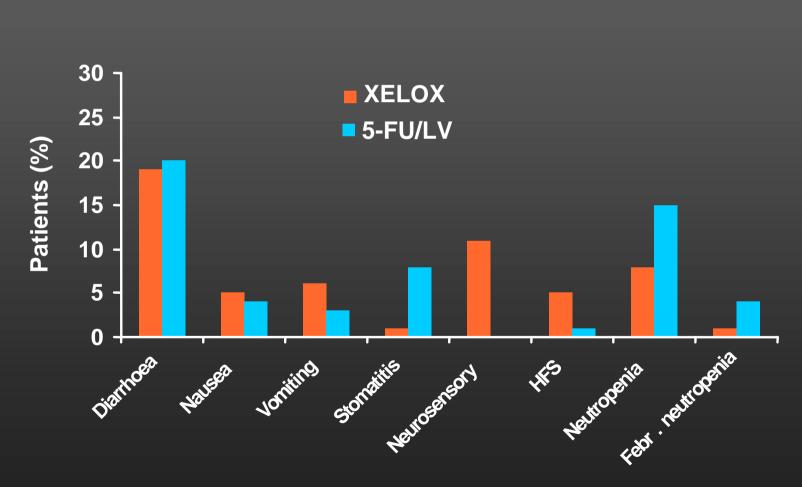

Capecitabine 1000mg/m² bid d1–14 q3w + oxaliplatin 130mg/m² i.v. d1 q3w

5-FU/LV (n=926)

- Mayo Clinic bolus 5-FU/LV
- Roswell Park bolus 5-FU/LV
- XELOX is feasible and safe¹
 - similar tolerability to bolus 5-FU/LV and FOLFOX4
 - better tolerability than FLOX
- Efficacy data are due at end of 2008

XELOX vs bolus 5-FU/LV: main grade 3-4 treatment-related toxicities

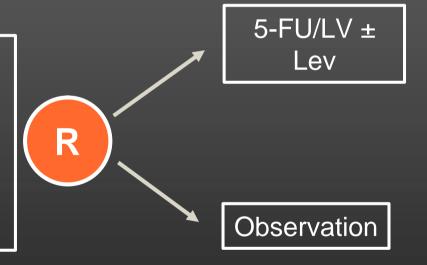

Schmoll et al, J Clin Oncol 2007

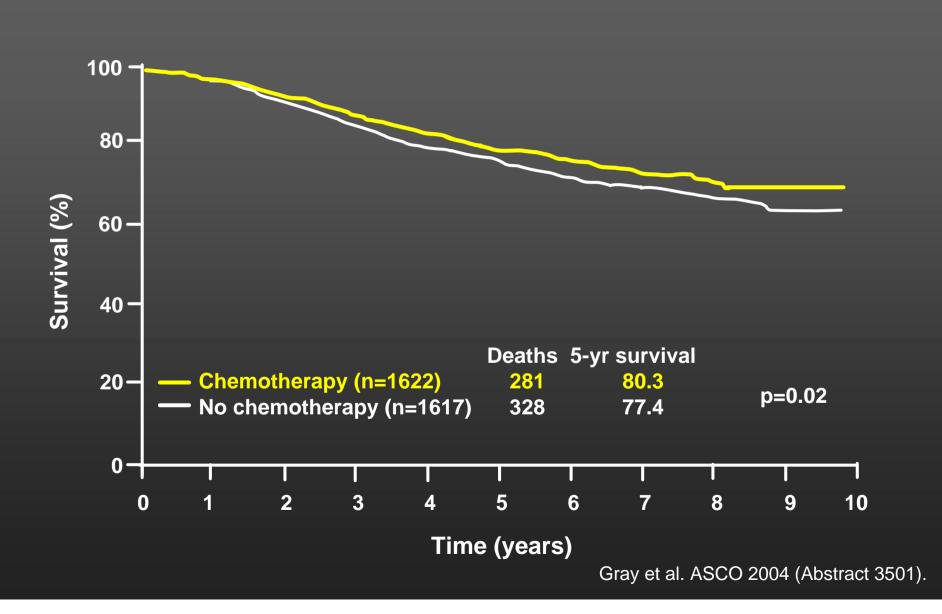

Stage II

QUASAR

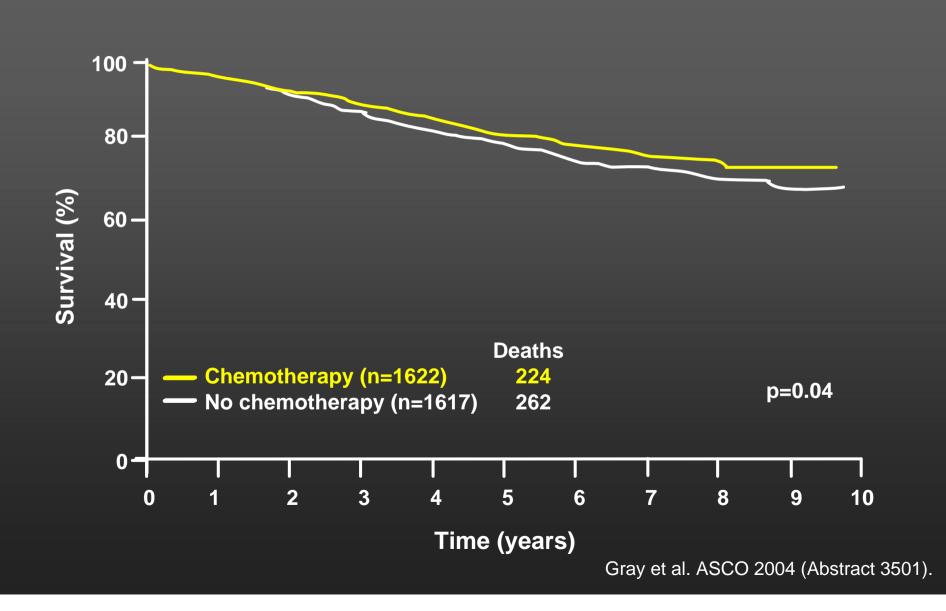

3239 patients with CRC and 'uncertain indication' for chemotherapy (1994–2003) (92% Dukes' B, 71% colon cancer)

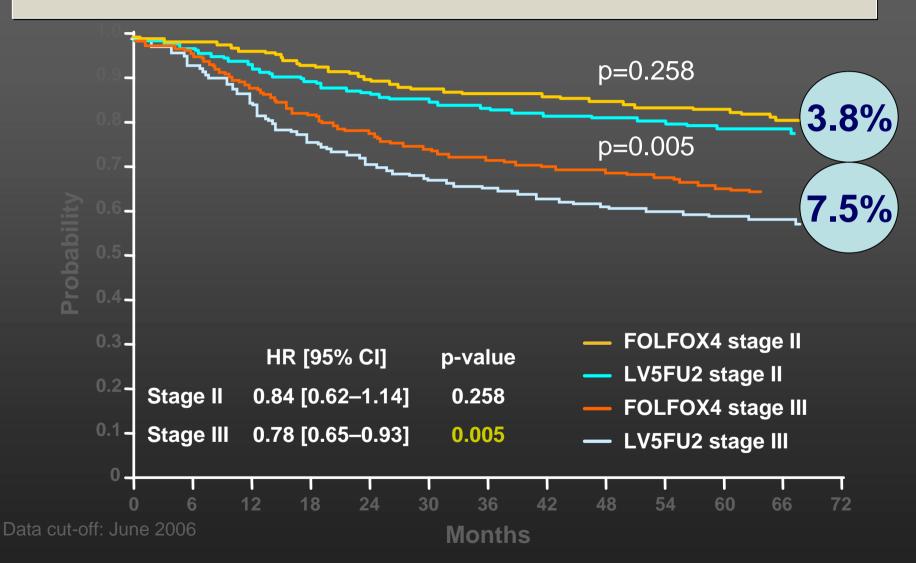

QUASAR: survival in ITT population

QUASAR: survival in stage II patients

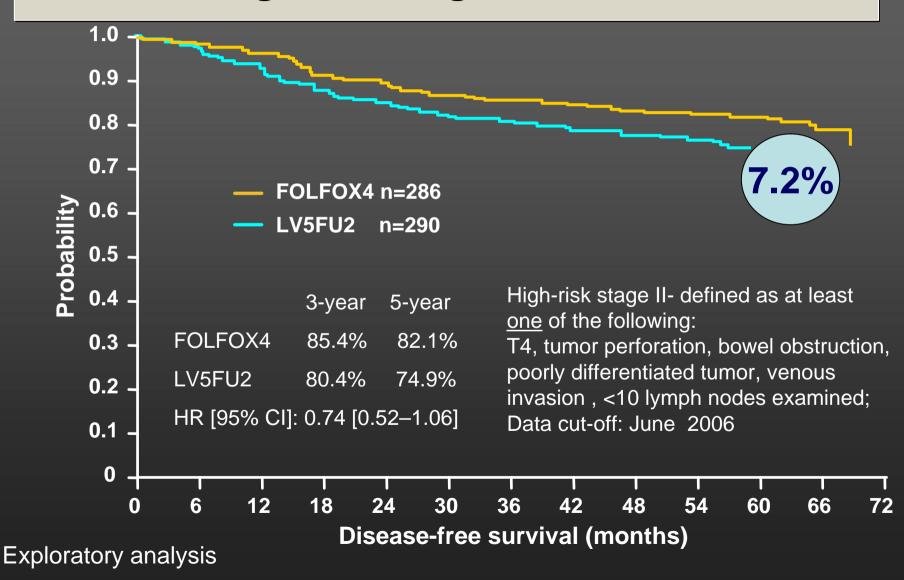

Mosaic: Disease-free Survival Stage II and III

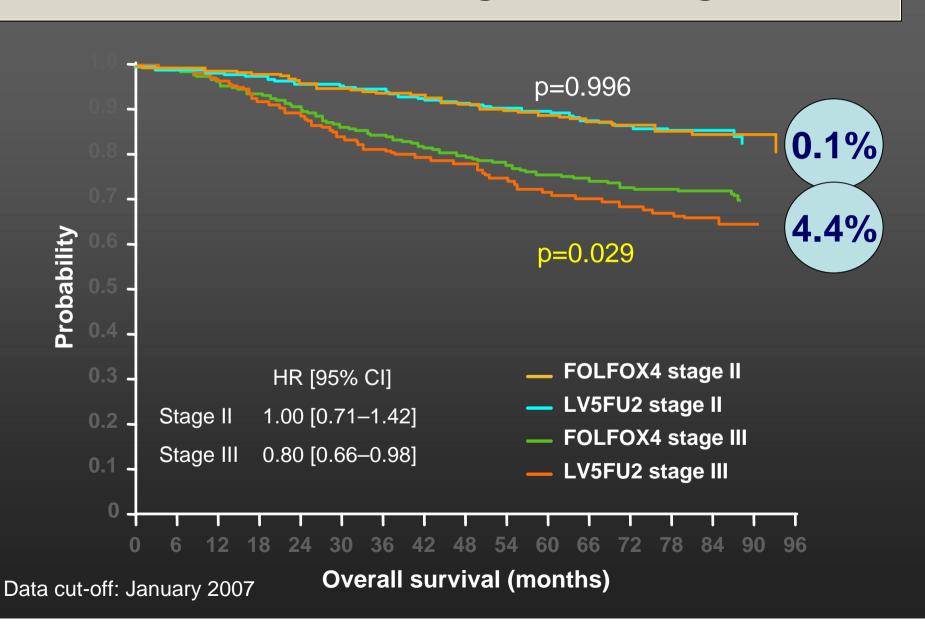

MOSAIC: high-risk stage II patients

- 64% of stage II patients were defined as high-risk:
 - T4
 - Bowel obstruction
 - Tumour perforation
 - Poorly differentiated tumour
 - Venous invasion
 - Number of examined lymph nodes <10

Disease-free Survival: High-risk Stage II Patients

Overall Survival: Stage II and Stage III

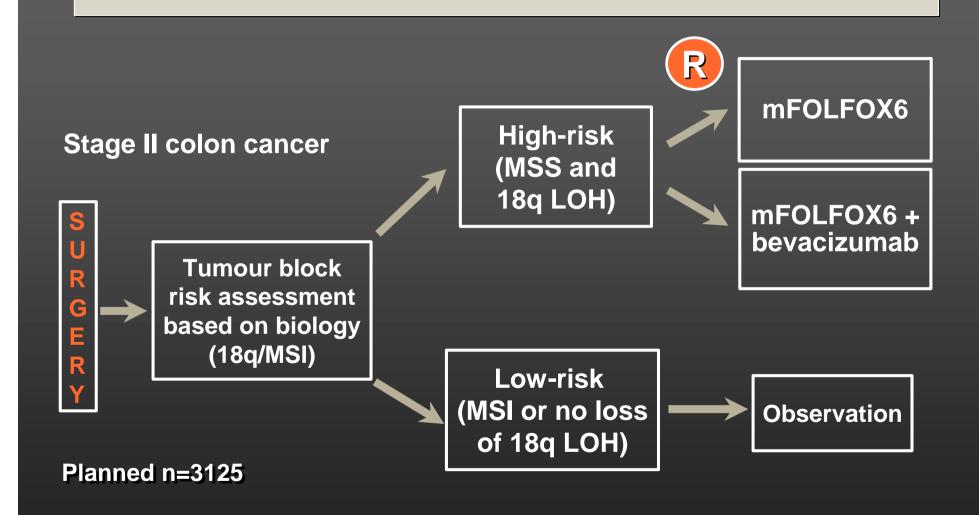

New guidelines for adjuvant treatment of colon cancer: NCCN 2006

- T1, N0, M0 and T2, N0, M0 (stage I)
 - No chemotherapy
- T3, M0, N0 (stage II, no high-risk features)
 - Consider single-agent fluoropyrimidine or 5-FU/LV + oxaliplatin
 - Deutscher Konsensus: keine Behandlung (im Einzelfall überlegen)
- N0 high risk

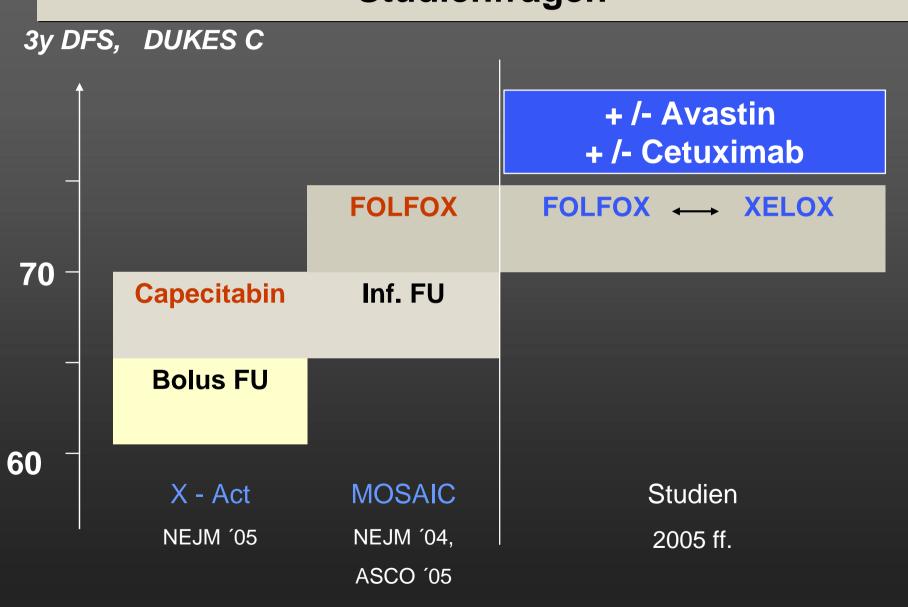

FOLFOX (XELOX)

Deutscher Konsensus: im Einzelfall entscheiden FOLFOX 6 Monate

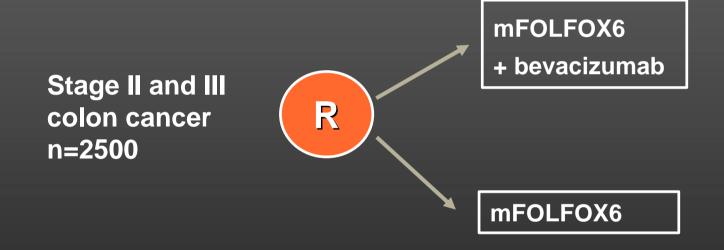

Future directions: E5202

Adjuvante Therapie des Kolon-Ca.: Studienfragen

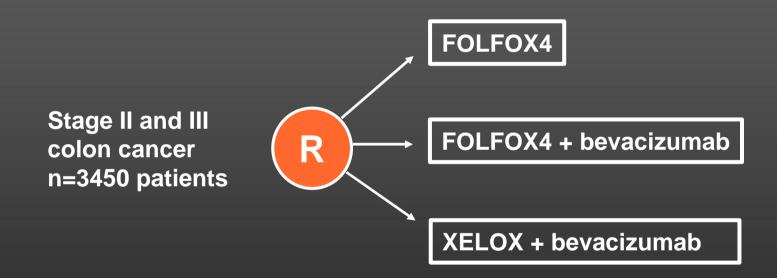

Future directions: NSABP C-08

Primary endpoint: DFS

AVANT: oxaliplatin-based chemotherapy + bevacizumab for stage II/III colon cancer

Primary endpoint: DFS

Future directions: NO147

Planned n=4800 R FOLFIRI R ± cetuximab

FOLFOX? FOLFIRI

Modification in June 2005:

Planned n=2400

FOLFOX

± cetuximab

Future directions: PETACC-8

Phase III trial

Fully resected stage III colon cancer

Planned n=2000

Treatment will be administered for 6 months

FOLFOX4

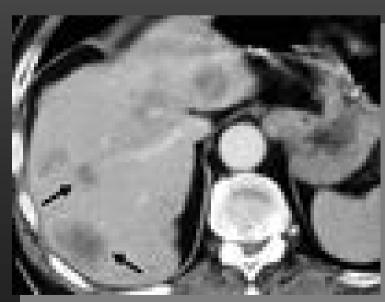

Primary endpoint: DFS

Liver metastases in ACRC

In 33%-35%: liver metastases only!

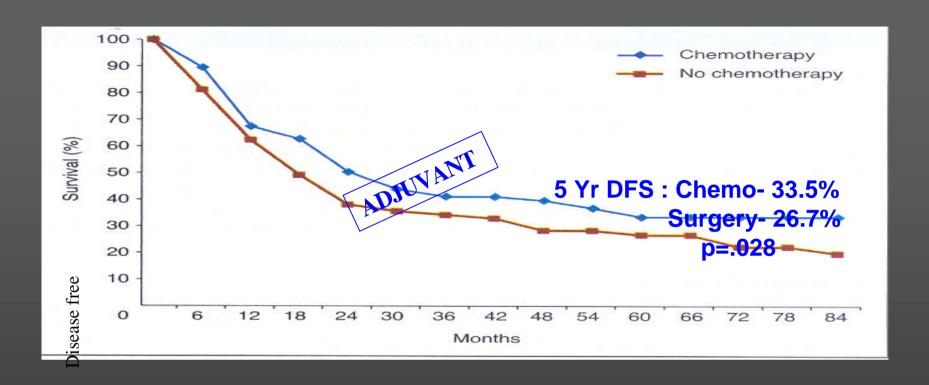

Prognosis after nach resection: Fong-Score

Table CLINICAL RISK SCORE FOR TUMOR RECURRENCE

Survival (%)

| Score | 1-yr | 2-yr | 3-yr | 4-yr | 5-yr | Median (mo) |
|-------|------|------|------|------|------|----------------|
| 0 | 93 | 79 | 72 | 60 | 60 | 74 |
| 1 | 91 | 76 | 66 | 54 | 44 | 51 |
| 2 | 89 | 73 | 60 | 51 | 40 | 47 |
| 3 | 86 | 67 | 42 | 25 | 20 | 33 |

Rectal Cancer

Possible role of chemotherapy in rectal cancer

In addition to perioperative radiotherapy:

enhance efficacy of radiation

▶ improve local control enable resection and sphincter preservation

Adjuvant systemic therapy - after perioperative (chemo)radiation

eradicate micrometastasis

P reduce rate of distant relapse

Before perioperative chemoradiation reduce local tumor size and eradicate micrometastases

Who cures rectal cancer?

Surgeons: optimal = radical surgery (TME)

is most important for cure

Radiotherapists: high dose radiation +/-

chemotherapy is most

important for cure

Medical Oncologists: systemic chemotherapy only

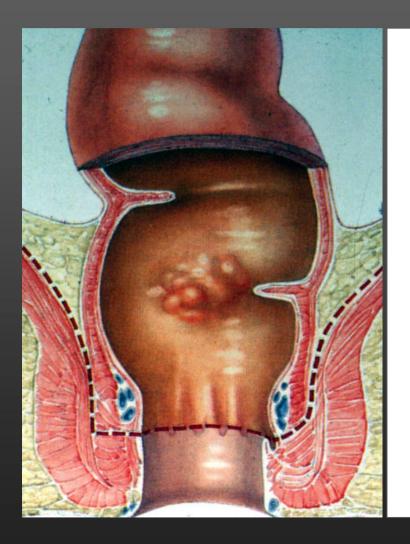

may effectively eradicate

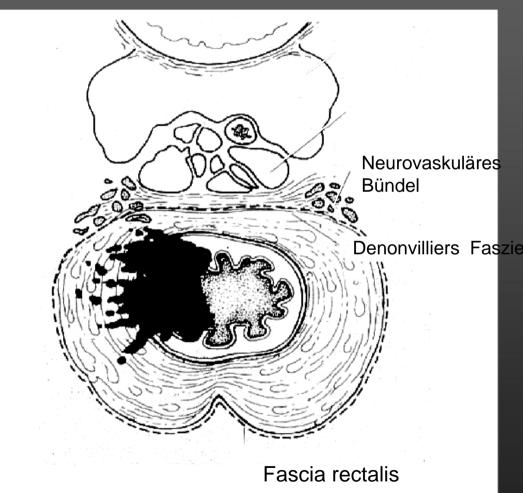

micrometastes

- locoregional

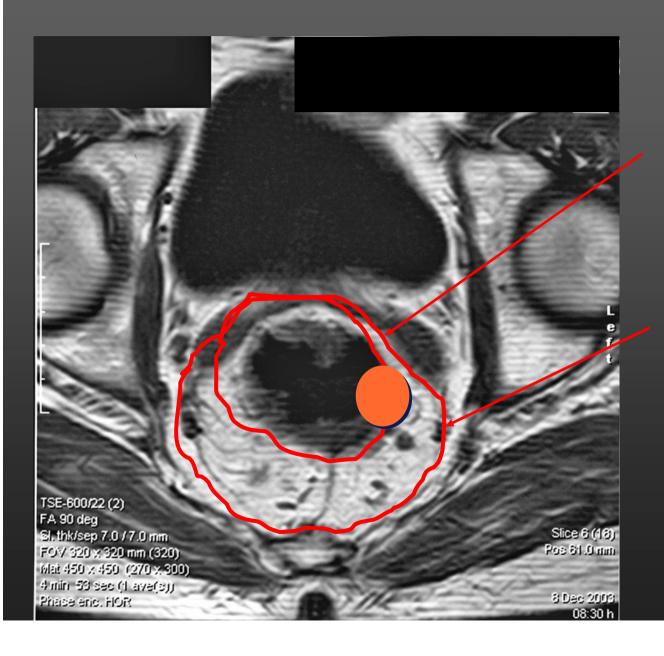

- systemic spread

Rectal Cancer: "Mesorectum"

From conventional surgery to TME

Conventional excision of the tumor.

TME: Sharp excission at mesorectal fascia (MRF).

PreOP trials: Patterns of failure

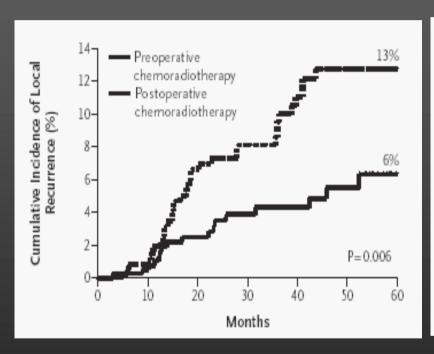

| | | local failure vs. | | dist me | ant ets. | 5y OS vs. | | |

EORTC trial: Effect of adjuvant chemotherapy on overall survival

 "Good prognosis" patients may be retrospectively identified as being those who achieved down-staging by pre-operative treatment

ypT0-2 ("good prognosis") patients significantly benefit from post-operative chemotherapy

 Patients with no down-staging ("poor prognosis") did not benefit of adjuvant CT

- Should these pts. be excluded from chemotherapy?
- or should these pts. receive more active chemotherapy?

Adjuvant chemotherapy: Open questions

Should patients with no downstaging be excluded from chemotherapy?

- or should these patients receive *more active* therapy?

What could be regarded as a *standard* in stage II/III rectal cancer after preOP Rtx.?

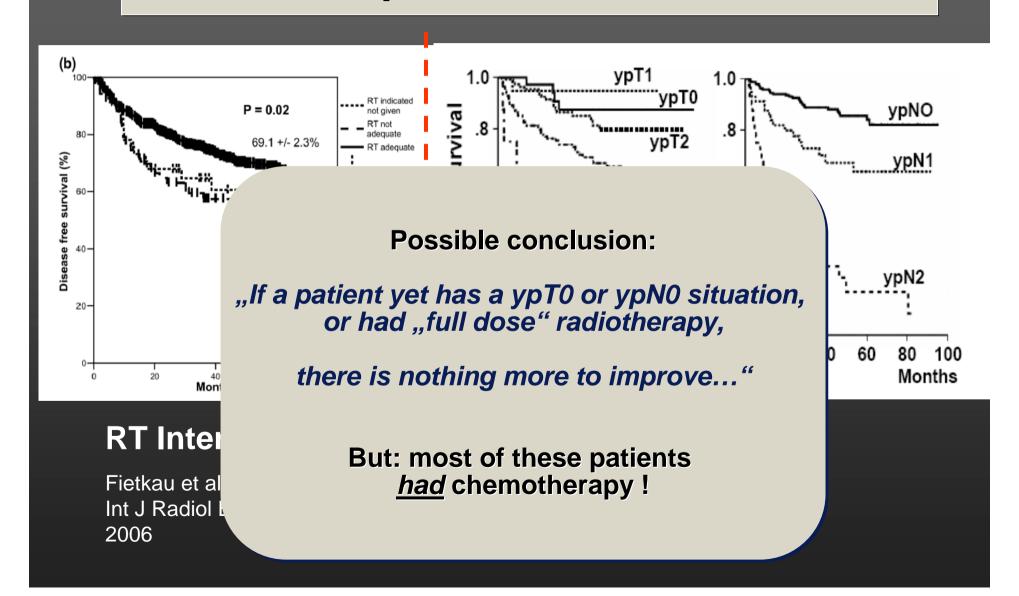

Is rectal cancer different from colon cancer?

New questions

•Do all patients need postoperative chemotherapy?

- Do they need "5-FU-only" chemotherapy
- •or more intensive regimen ?

If adjuvant chemotherapy: Are all patients in need of it?

Rectal Cancer different from Colon Cancer?

- specific anatomical location:
- yes, but only a risk for local relapse, not for survival
- metastatic behavior different:
- no data demonstrating real difference
- different sensitivity to chemotherapy:
- rectal vs colon primary tumor: no sign. difference
- different biology/gene signature:
- probably, but not related to clinical behavior,
- chemosensitivity etc.

Which treatment should be administered?

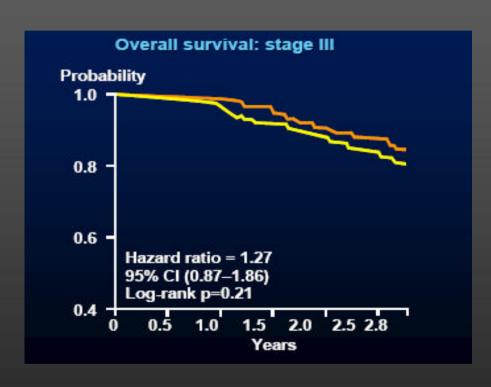

5-FU

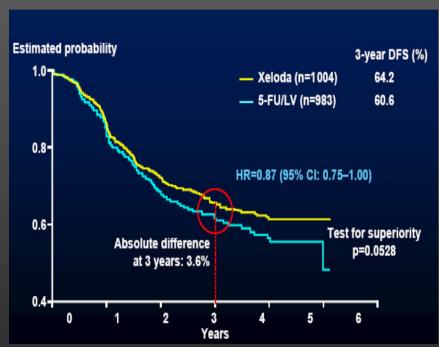

bolus FU/(FA): Standard in post-OP trials

Positive trials: EORTC (trend), Quasar, Japan (with UFT)

Capecitabine may be substitute (-> colon cancer experience)

No Bolus 5-FU in adjuvant therapy of stage III colon cancer anymore

5FU inf / FA

André et al., J Clin Oncol 2003

Capecitabin

Twelves et al., NEJM 2005

Which treatment should be administered?

5-FU

bolus FU/(FA): Standard in post-OP trials

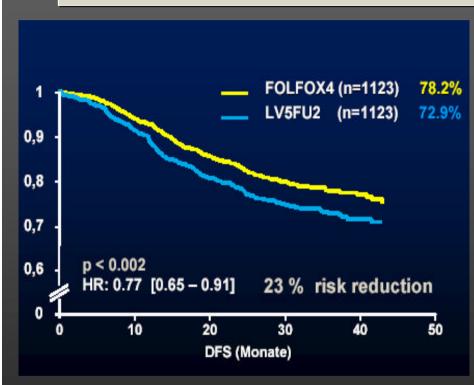

Positive trials: EORTC (trend), Quasar, Japan (with UFT)

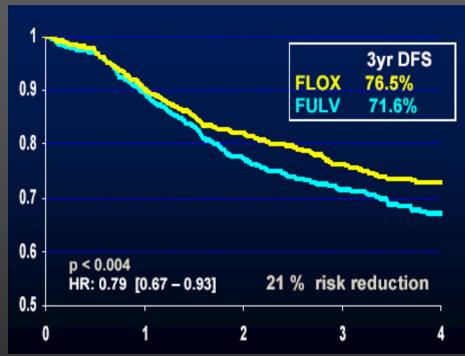

Capecitabine may be substitute (-> colon cancer exp.)

5-FU/ Oxaliplatin

Standard in colon cancer stage III/(II)

Colon cancer stage II/III: Oxaliplatin combinations > FU/FA

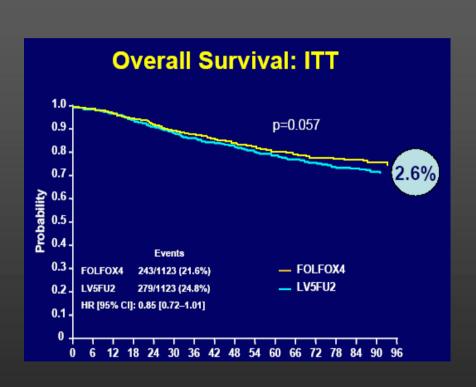

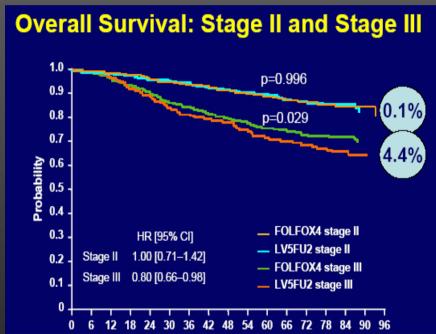

MOSAIC

NSABP C07

Recent Overall Survival Data: Supporting Oxaliplatin Combinations

Which treatment should be administered?

5-FU

bolus FU/(FA): Standard in post-OP trials

Positive trials: EORTC (trend), Quasar, Japan (with UFT)

Capecitabine may be substitute (-> colon cancer exp.)

5-FU/ Oxaliplatin

Febrile neutropenia

Pre- and post-OP chemotherapy with XELOX

■AIO/ARO/CAO trial (n=110, J Clin Oncol 2007)

■CORE trial (n= 93, ASCO 2006)

- Post-operative combination with capecitabine and oxaliplatin is feasible
- No increased perioperative complications when started after 4 weeks postoperatively or later

XELOX pre- and postoperatively in rectal cancer: Phase II trial

| | preOP chemorad | | postOP adjuvant | |
|------------------------|----------------|-----------|-----------------|-----------|
| | Grade 1,2 | Grade 3,4 | Grade 1,2 | Grade 3,4 |
| Leukopenia | 50 | 4 | 67 | 1 |
| Diarrhea | 55 | 12 | 33 | 12 |
| Nausea | 48 | 6 | 67 | 7 |
| Stomatitis | 7 | 1 | 7 | 0 |
| Hand-Foot- syndrome | 8 | 1 | 34 | 1 |
| Infection | 6 | 3 | 7 | 2 |

Which treatment should be administered?

5-FU

bolus FU/(FA): Standard in post-OP trials

Positive trials: EORTC (trend), Quasar, Japan (with UFT)

Capecitabine may be substitute (-> colon cancer exp.)

5-FU/ Oxaliplatin

Standard in colon cancer stage III/(II)

Capecitabine / Oxaliplatin

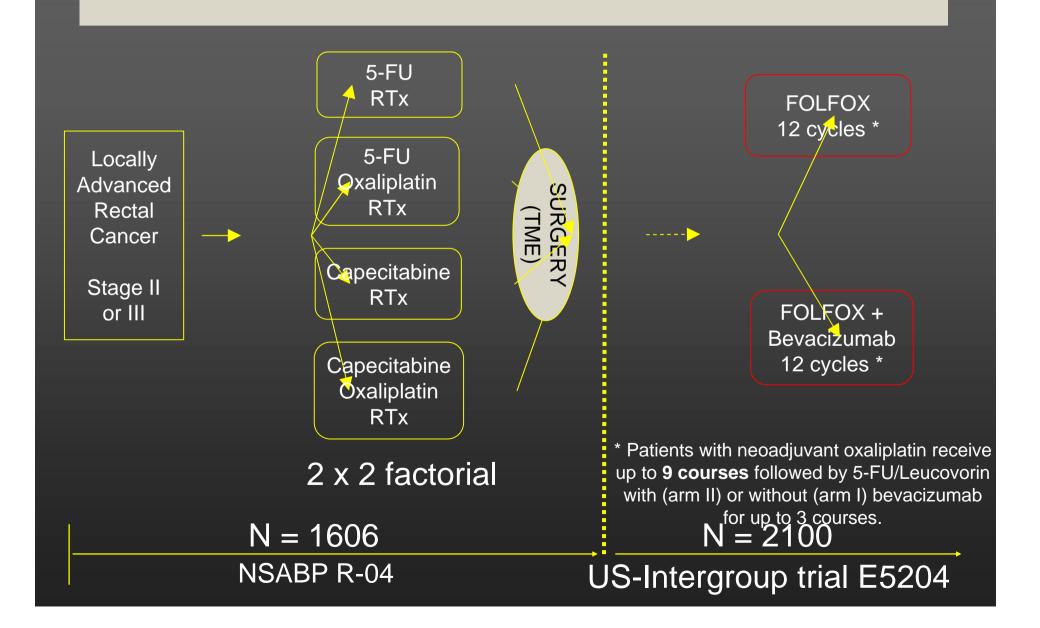

well tolerated, effective

experience in colon (XELOX) and rectum (CORE, German)

"Targeted drug" combinations

FOLFOX or XELOX with bevacizumab or cetuximab feasible

NSABP US-Intergroup Trial - Rectal Cancer

More data in favour of chemotherapy!

5-FU

bolus FU/(FA): Standard in post-OP trials

Positive trials: Quasar, Japan (with UFT), EORTC (subgr.)

Capecitabine may be substitute (-> colon cancer exp.)

5-FU/ Oxaliplatin

Standard in colon cancer stage III/(II)

Capecitabine / Oxaliplatin

well tolerated, effective

experience in colon (XELOX) and rectum (CORE, German)

"Targeted drug" combinations

FOLFOX or XELOX with bevacizumab or cetuximab feasible

PETACC-6 EORTC 40054-22062

Preoperative chemoradiotherapy and postoperative chemotherapy
with capecitabine and oxaliplatin
vs. capecitabine alone
in locally advanced rectal cancer

Treatment Arms in PETACC-6

CONTROL **CONTROL ARM** <u>ARM</u> locally followadvanced capecitabine capecitabine up rectal RTx cancer 6 cycles RANDOMIZATION clinical stage T3 or T4 or any **INVESTI-INVESTI**node-**GATIONAL GATIONAL** positive <u>ARM</u> <u>ARM</u> disease followcapecitabine capecitabine up ECOG PS oxaliplatin oxaliplatin <u><</u>2 RTx 6 cycles 6-8 weeks days 1-38 4-6 weeks 18 weeks weeks

Endpoints

Primary:

Disease-free survival (+7% at 3 years), defined as the interval from randomization to loco-regional failure, metastatic recurrence, the appearance of a secondary colorectal cancer or death, whichever occurs first. Loco-regional failure is defined as local or regional recurrence, inoperable disease, R1 or R2 resection.

Secondary:

Overall survival

Pathological downstaging (ypT0-T2N0) rate

Pathological complete remission rate

Histopathological R0 resection rate

Tumor regression grading

Sphincter preservation rate

Perioperative surgical complication rate

Toxicity

Loco-regional failure rate

German Multicenter Phase-II Study

Oxaliplatin: 50 mg/m²

Capecitabine: 1650 mg/m²/d

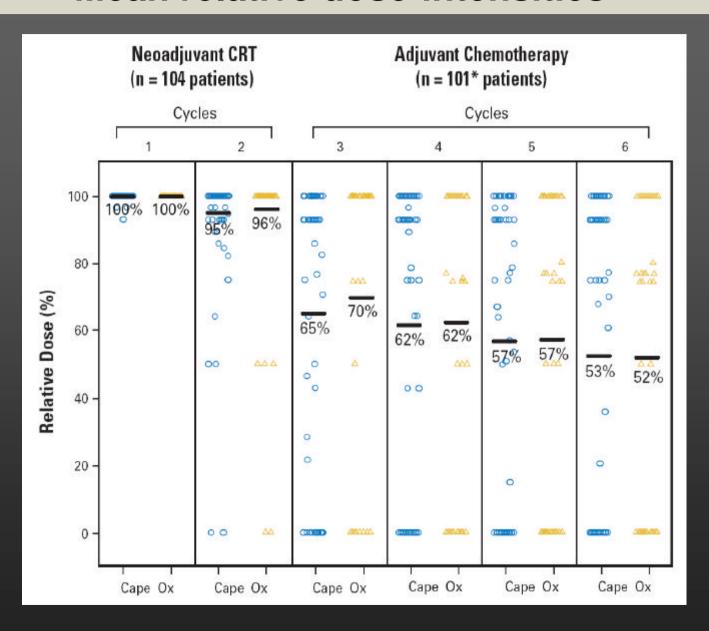

RT: 1.8 Gy to 50.4 Gy

Oxaliplatin: 130 mg/m²

Capecitabine: 2000

mg/m²/d

Mean relative dose-intensities

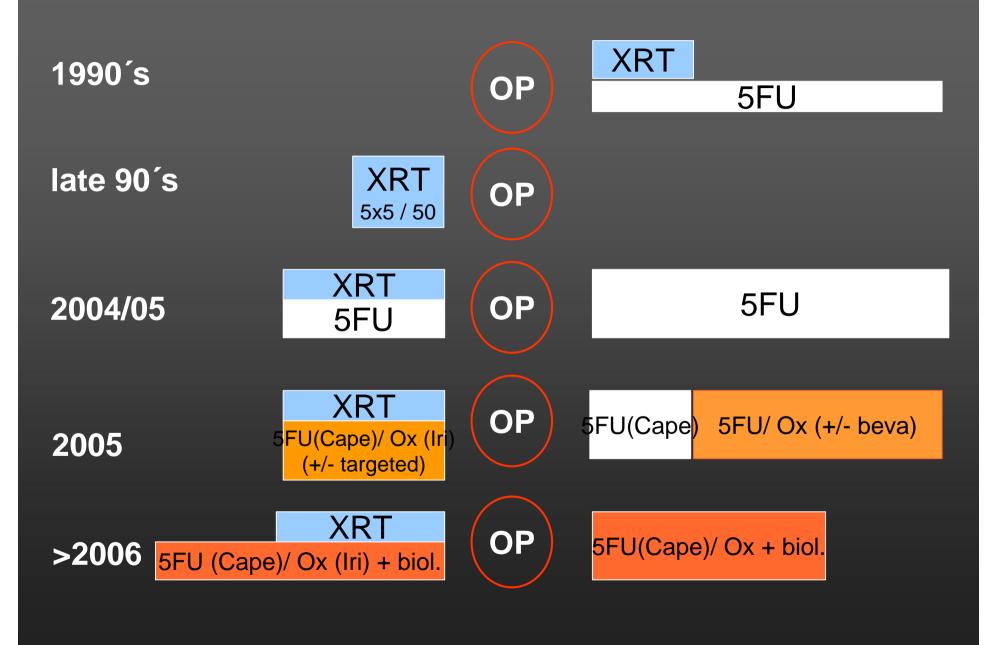

Main eligibility criteria

- Histologically proven adenocarcinoma of the rectum
- (tumour = 12 cm from the anal verge)
- cT3/4 or N+
- No evidence of metastatic disease
- No prior radiotherapy to the pelvis, for any reason
- The disease must be considered either resectable at the time of entry or thought to become resectable after preoperative chemoradiation
- ECOG Performance Status = 2
- No peripheral neuropathy = grade 2

Organisation

- Sponsor/Database: EORTC
- Leading group is the EORTC GI Group
- Investigator fee of approximately 500€ per patient
- Capecitabine and oxaliplatin will be supplied free of charge
- Telefone Monitoring

Evolution of rectal cancer approaches

Preoperative Regimens

| | Control arm | Investigational arm | |
|--------------|--|--|--|
| Capecitabine | 825 mg/m ² PO BID on days 1-33 w/o weekends | 825 mg/m ² PO BID on days 1-33 w/o weekends | |
| Oxaliplatin | | 50 mg/m² IV on days 1, 8, 15, 22 & 29 | |
| Radiation | 45 Gy, 1.8 Gy on days 1-33 w/o weekends Optional: 5.4 Gy day 36-38 with capecitabine 825 mg/m ² PO BID * | 45 Gy, 1.8 Gy on days 1-33 w/o weekends Optional: 5.4 Gy day 36-38 with capecitabine 825 mg/m² PO BID * | |

^{*} Centres have to choose one option and adopt it for both arms for the entire study.

Postoperative Regimens

| Control arm | Investigational arm | |
|--|---|--|
| 6 cycles of: | 6 cycles of: | |
| Capecitabine 1000 mg/m² PO BID on days 1 to 14 | Capecitabine 1000 mg/m² PO BID on days 1 to 14 | |
| | Oxaliplatin 130 mg/m² IV on day 1 | |
| Otani mani anala an dan 20 l | Of and month and the second and the | |

Start next cycle on day 22!

Start next cycle on day 22!

Translational Research

- GENEPI-2 participation as a trial with a central storage of blood and tissue
- Pharmacogenomics studies related to capecitabine, or oxaliplatin.
- Immunohistochemical expression relevant biological markers in tumour tissue and gene expression arrays
- Proteomic analyses
- Blood/Tissue collection for further research.

Organisation

- Sponsor/Database: EORTC
- Leading group is the EORTC GI Group
- Investigator fee of 458€ per patient
- Capecitabine and oxaliplatin will be supplied free of charge

Study Coordinators

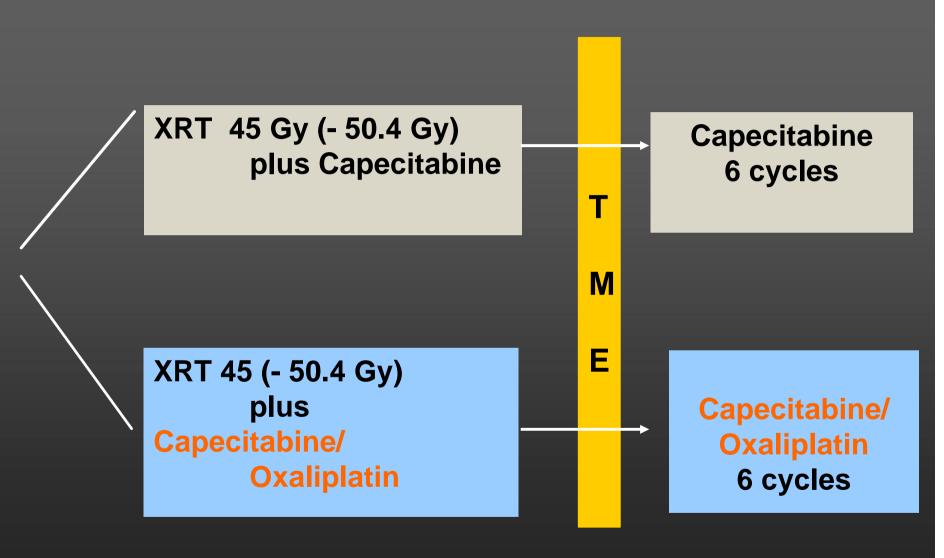

Chemotherapy: Hans-Joachim Schmoll

(Chair Steering Committee)

Radiotherapy: Karin Haustermans

Surgery: Christophe Penna

PETACC-6 trial: T3,4 or N+ (N=1120)

Endpoint: Disease free survival after 3 years (6%)

Possible role of chemotherapy in rectal cancer

In addition to perioperative radiotherapy:

enhance efficacy of radiation

P improve local control enable resection and sphincter preservation

Adjuvant systemic therapy - after perioperative (chemo)radiation

eradicate micrometastasis

P reduce rate of distant relapse

Before perioperative chemoradiation reduce local tumor size and eradicate micrometastases

Neoadjuvant chemotherapy as first modality
